

Ball Valves

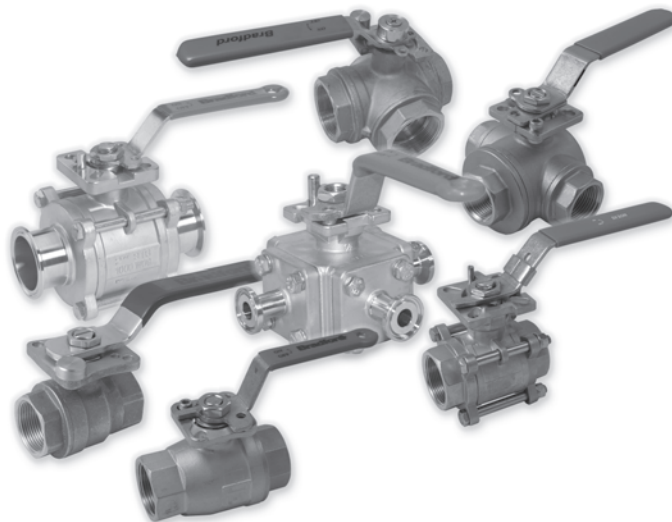

Bradford™ 2-way ball valves are quarter-turn, straight through valves that use a ball to shut off flow by sealing around matching seats to create uniform sealing. Ball valves are used in situations where tight shut off is necessary. 3-way ball valves are available in quarter turn or 180°.

Bradford™ ball valves provide superior ease of operation and can maintain and regulate high volume, high pressure, high temperature flow. Bradford™ ball valves offer rugged construction providing for a long service life, and a comparably low cost.

Dixon Sanitary's offers a wide selection of ball valves for use in varies applications. These valves are simple, rugged and above all, dependable.

Pneumatic and electric actuators are available for automated control.

All Bradford™ ball valves are assembled without silicone lubricants.
